

The Electrical Project Supervision (EPS)

The Electrical Project Supervision (EPS) program consists of three integrated levels of instruction. Each level addresses the topic of project supervision, and successive levels are built upon the foundations established at the earlier level. All three levels provide important learning and skills for supervisors with a wide range of responsibilities.

While some materials in one level may be beyond what most foremen might need to accomplish their immediate responsibilities, the program enriches their understanding of the business and process of construction and gives them insight into what might be ahead as they move up the administrative ladder. At times, some material might seem elementary for experienced supervisors, but it allows them to review basics they may overlook with their advanced responsibilities. Another benefit of the program's structure is the peer-to-peer interaction between new and experienced supervisors

Topics covered include defining the supervisor's role, team building, verbal communication, written communication, performance management, employee relations, safety, production management, planning and scheduling, tool and material management, and understanding costs.
